

AI Presentation Generation by Salman Ahmed

Introduction

The objective of this task was to generate a professional presentation from a YouTube orientation class video using AI tools. Different prompts and AI platforms were tested to identify the most effective approach for creating high-quality presentation slides.

AI Tools and Models Used

The following AI tools were used during the process:

- ChatGPT – To research the best method for generating presentations from YouTube videos.
- YouTubeToTranscript (youtubetotranscript.com) – To extract the transcript from the YouTube orientation video.
- Pi.inc (using a Gemini-generated prompt) – To convert the transcript into structured presentation slides.
- Slidesgo AI – To generate a PowerPoint presentation directly from the transcript and prompt.

Complete Process Followed

1. Searched on ChatGPT for the best way to generate professional slides from a YouTube orientation class video.
2. Extracted the video transcript using YouTubeToTranscript.
3. Copied the transcript into Pi.inc and used a detailed Gemini-generated prompt to create a structured slide presentation.
4. Reviewed the generated slides and obtained a shareable presentation link.
5. Used the same transcript and prompt in Slidesgo AI to generate a PowerPoint presentation.
6. Compared the outputs from both tools and selected the best presentation for the final result.

Prompts Used

Initial Prompt

"Convert this orientation class transcript into presentation slides."

Refined Prompt

An advanced prompt was used that instructed the AI to:

- Create one slide for each major heading.
- Convert paragraphs into concise bullet points.
- Use professional formatting and clear slide titles.
- Suggest suitable visuals for each slide.
- Maintain a corporate and academic tone throughout the presentation.

Which Prompts Worked Effectively

The refined prompt produced the best results because it clearly defined the slide structure, formatting style, content organization, and visual recommendations. The generated slides were well-organized and required minimal editing.

Which Prompts Did Not Work Well

The simple prompt, "Convert this orientation class transcript into presentation slides," produced generic results. Some slides contained too much text, lacked proper organization, and did not include suggestions for visuals or formatting.

How the Prompts Were Refined

The initial prompt was improved by adding specific instructions about:

- Slide-by-slide organization.
- Professional bullet point formatting.
- Clear and action-oriented titles.
- Visual recommendations.
- Maintaining a concise and presentation-friendly style.

These refinements significantly improved the quality and readability of the generated slides.

Conclusion

This exercise demonstrated that the quality of AI-generated presentations depends greatly on the quality of the prompt. By refining the prompt with clear instructions and using multiple AI tools, a professional and well-structured presentation was successfully created with minimal manual effort.
